Modernize or Create Computing Courses

Alex Shaw and Baha Marupov are software professionals and college educators. We help colleges update computing courses and programs, and create new courses.

While teaching at colleges, we saw how quickly technology changes - and how much work it takes to keep courses current while teaching and supporting students. Access exists to help with that work.

College budgets can also make it difficult to match the salaries offered by technology companies.

Three Ways We Can Help

Review and Update Courses and Programs

A defined project reviews content, tools, learning goals, prerequisites, and course sequence. Receive a prioritized plan and agreed revisions to materials and assessments.

Create a New Computing Course

Develop a course plan with lessons, labs, projects, assessments, and instructor guidance. Receive editable materials that your faculty can use and adapt.

Annual Curriculum Partnership

Keep Courses and Programs Current

An annual review, agreed updates, and faculty consultation during the year help your courses and programs reflect changes in technology and workforce needs.

Review together / agree priorities / update materials / review the changes with faculty

Receive updated materials, a record of changes, remaining priorities, and a plan for the next year.

Agree on the Work Before We Begin

We agree on the covered courses or program, revisions, consultation, schedule, and fee. Additional work is scoped separately. Faculty make the academic decisions and approve the finished work.
